Low Vitamin D

Your recent blood test may have shown you have borderline low levels of Vitamin D

What is Vitamin D?

Vitamin D helps regulate the amount of calcium and phosphate in the body.

These nutrients are needed to keep bones, teeth and muscles healthy.

A lack of vitamin D can lead to bone deformities such as [rickets](#) in children, and bone pain caused by a condition called osteomalacia in adults.

Long Term Over The Counter to Boost your Levels

We recommend you should obtain a **long-term maintenance** dose of Vitamin D supplements which you should get over the counter from your local chemist or health food shop. (Note - We cannot prescribe the maintenance dose, as per CCG guidelines).

The recommended dose for maintenance is **1000 units per day**. If you are already on this you do not need to do anything different.

If you are unsure your local pharmacist will be able to advise on a suitable product.

What Else Can You do?

Vitamin D Lifestyle and Dietary Advice:

Sunlight: 20 – 30 minutes each week between 10 am and 3 pm in summer (April – September) should provide adequate amounts of Vitamin D for most individuals. The elderly and those of non-white ethnicity will have higher requirements

Diet: Oily fish such as herring, sardines, mackerel, salmon and tuna are the best dietary source of Vitamin D. Egg yolks and mushrooms also contain small amounts and there are also some foods such as margarines and cereals that are fortified with Vitamin D (check product label)
